

*The Principle of 'Contra-Boolean Self-Combinatorics' / 'Self-Hybridization' of Categories &/ or of their Units.*

The *axioms, & rules of interpretation*, of the NQ language, are typically *applied* by *us* so as to *form* 'meta-equation meta-models' of the *dialectics in Nature*, in the *cosmos* as a *whole*, with human-social "eventities" most decidedly included therein, as part thereof, and *built* using that NQ language.

As such, those *axioms, & rules of interpretation* are *designed specifically* to *capture* [self-]«aufheben» 'meta-«monad»-ization' *processes* [for *diachronic interpretations*] &/ or 'meta-«monad»-icity' *relations* [for *synchronic interpretations*].

They do so by means of something that is *alien* to the *Boolean* «mentalité»: the provision, in *contrast* to Boole's  $x^2 = x^1$ , for a *consequential form* of, "epigenetic", 'self-combination' --

$$x \rightarrow \exists xx \neq x; \quad xx = x^2 = x \boxplus \square x \quad \ddagger \quad x, \text{ because } \square x \quad \ddagger \quad x.$$
